

Quench Root Development Enhancer

Quench is recommended for foliar application by air assisted or conventional hydraulic sprayers. The polymer formulation ensures that Quench is rainfast within 30 minutes. Quench is compatible with a wide range of agrochemicals. Correct timing of application is necessary to optimise the biological activity required to enhance root development and growth.

Directions For Use:

Timing

Quench is highly effective when applied to crops early in their development, prior to the onset of vegetative growth. It will then increase early root growth and plant establishment, improve overall plant vigour.

Crop	Rate per hectare	Timing
Cereals	1 l/ha	3 leaves - 1 tiller (GS 13 - 21)
Oilseed rape	1 l/ha	4 - 6 true leaves

Mixing

Half fill the spray tank with water and add the required quantity of Quench whilst agitating. Add any other agrochemicals which are to be applied at the same time and top up the tank to the final volume. Continue agitation throughout the spraying operation. Do not allow spray solution to stand. Use immediately.

Water volume

Apply in sufficient water to ensure adequate cover of the target crop. Normally 120 to 200 litres of water per hectare.

Compatibility

Contact your agronomist for specific compatibility information.
